

Business VoIP

Experience major savings with business VoIP.

A Voice Over Internet Protocol Product

Do you already have a long-term commitment with your existing phone system or simply not interested in spending money on a new phone system? Are you looking for ways to lower your business calling costs without replacing your phone system or phones?

If so, you should make the smart move to Datavo Business VoIP and reduce your monthly phone bills by running voice and data on the same network. Voice over Internet Protocol (VoIP) is an IP-based, networking technology that can carry digital voice information over a data network, producing an experience exactly like a traditional telephone conversation.

Our Business VoIP offering has been designed with ease of installation and use in mind. We will arrange a qualified Datavo technician to complete the transition from your existing analog service to VoIP. Our technician will confirm your existing broadband network has the capability to deliver our VoIP solution, install, configure and connect our equipment to your phone system and ensure your business is saving money today.

Once converted you should not notice any difference in the quality of the call and can use your phones exactly as you would with your previous analog phone lines.

Product Description:

Our bonded ADSL2+ product provides customers with a high speed broadband data solution capable of download speeds up to 8Mb.
