

PRI

Accelerate your business with Fortune 500 telecom solutions.

Voice Only T1

Start saving your business money on telephone service by installing a PRI from Datavo!

A PRI (Primary Rate Interface) is an ISDN equivalent of a T1 circuit. Most businesses currently use POTS which are standard analog lines that provide access for local and long distance calling. They are used for such things as making and receiving telephone calls, faxing, modems, security systems and credit card/ATM machines. Savings are highest when replacing 13-23 POTS lines with a Datavo PRI.

A Datavo PRI digitally delivers your local and long distance calls to your business over one, reliable 4-wire interface. Your Datavo PRI has 23 channels that move voice and data at 64 Kbps. Reduce your network costs by incorporating a Datavo PRI into your existing telecommunications blueprint and eliminate traditional telephone line charges. A Datavo PRI maintains a dedicated connection to 911 centers ensuring our customers have access to 911 services at their office location even when switching away from a traditional telephone line.

Product Description:

This is the perfect voice solution for medium sized businesses with 10 to 20 employees who need:

- the guaranteed quality of service provided over a PRI.
- an efficient, maximum uptime solution providing reliable voice access.
- to lower the overall cost of their monthly telecom billing.

and who are thinking of:

- acquiring a high speed data service in the near future.
- moving their data service from their existing service provider.
- upgrading their existing data service.
